

Other windows

- **The Console window** - logs of warnings, errors or any other such messages that might be generated.
- **The Animation window** - allows for animation of objects in the scene.
- **The Profiler window** - used to thoroughly investigate any choke ups or bottle-necks in the game.
- **The Lighting window** - literal name; enables control of the lighting in your scene.
- **The Occlusion Culling window** - Occlusion Culling is a feature in Unity that disables rendering of objects that are not in the current view of the camera. This is done because they are obscured (namely, occluded) by other game objects. This window allows for management of Occlusion Culling so that the performance of the game is enhanced and not hampered during the actual gameplay.
