

The Unity Profiler Window

areas of your game. For example, it can break down the amount of time (in percentages) that you spent rendering, animating or even in your game logic. It can also analyse and report on the performance of your CPU, GPU, rendering, memory and audio.

In order to access the data from profiling, you will need to play your game in the Editor with 'Profiling' turned on. The Profiler window will then display your data in the format of a timeline so that you can see any areas or frames that spike (take longer in terms of time) more than others. **d**
