

The Scene View in Action

Scene Gizmo

The Scene Gizmo is located in the upper-right corner of the Scene View and it displays the current orientation of the camera. You can also easily modify the viewing angle and projection mode. The Scene Gizmo displays a conical arm on each side of the cube. You will find X, Y and Z labels on the

arms at the forefront of the gizmo. You can adjust the position of the scene view camera by selecting on the relevant conical axis arms. For instance, you just need to select top view, left view and front view to place objects accordingly. A menu with a list of all possible viewing angles will be displayed upon right clicking the cube. You can return to the default viewing angle by right clicking the Scene Gizmo and selecting the option Free.

With Scene Gizmo, you can activate and deactivate Perspective by toggling. The purpose of this method is to swap the projection mode between Perspective and Orthographic. In Unity developer's parlance, the term Orthographic is also called as isometric.

To perform this task, you should click the cube from the center of the Scene Gizmo. You can also select the text located beneath the cube. If the scene view is in an uncomfortable position such as upside-down, you should use the combination of Shift and click with the cube to bring back to a Perspective view. It will look like an angle that is facing towards the scene
