

moving, scaling and rotation operations under a single umbrella. To move the GameObject, you should click and drag from within the Gizmo. You can scale the GameObject by clicking and dragging on any corner of the rectangular Gizmo. If you would like to scale the GameObject along one axis, you need to drag an edge. If you drag a corner, you can easily scale the GameObject on two different axes.

It is possible to rotate the GameObject by positioning your cursor around the corner of the rectangle. You will be able to see that the cursor changes to rotation icon, using which you can drag to rotate the GameObject. It is to be noted that you can't modify the z-axis in the Scene in 2D mode.

Transform

The Transform tool is the combination of Move, Rotate and Scale tools. You can use its Gizmo to move and rotate objects. The tool also provides handles for scaling the selected GameObject. However, you have to set the property of the Tool Handle Rotation to Local.

Using Gizmo position toggles

The Toolbar includes position toggles using which you can handle Gizmos. They are used to define the location of any Transform tool including the ability to manipulate the Gizmo. You should click the Pivot/Center button located on the left to toggle between Pivot and Center. While Pivot is used to position the Gizmo at the relevant pivot point, the Center positions the Gizmo at the centre of the rendered bounds inside the concerned GameObject.

As far as rotation is concerned, you should click the Local/Global button located on the right side. The Local is used to position the rotation of the Gizmo according to the GameObject. Meanwhile, Global option is used to properly orient the Gizmo to the correct position.

To perform Unit snapping, you should hold the Control key while drag-

Move X	1
Move Y	1
Move Z	1
Scale	0.1
Rotation	15
Snap All Axes X Y Z	

Unit Snapping

ging Gizmo axis using the Move or Transform tool. This technique is done for the purpose of increment snapping. You can define them by navigating to Edit>Snap Settings. If you use the combination of Shift and Control, you can carry out surface snapping.
