

Change the look and feel of the scene with control bar

You need to press Shift and Control key to rotate the GameObject using the Rotate or Transform tool.

It is possible to quickly assemble your scenes with the help of Vertex snapping. Firstly, you need to remove any vertex from a given mesh. You should place the vertex in the same position as other vertexes from any mesh of your choice. To work with Vertex snapping, you should select the mesh you would like to manipulate and activate the Move or Transform tool. You should press and hold the V key, which will activate the vertex snapping mode. You should move the cursor over the relevant vertex that should be set as the pivot point. The next step is to hold the left mouse button when your cursor is over the vertex. Once you are satisfied with the results on the screen, you should release the mouse button and the V key. The Unity provides several permutations and combinations since you can snap vertex to vertex, pivot to vertex, and vertex to surface.

You can easily activate Screen Space mode by holding down the Shift key while you are working with the Transform tool. You will be able to move, rotate and scale GameObjects as if they appear on the screen instead of the scene.

Working with Scene View Control Bar

The Scene View Control Bar provides a wide range of options for viewing the scene. Moreover, the control bar also helps you to check whether the lighting and audio are enabled. As a Unity developer, you will be able to make use of the options available on the bar during the development phase.

The first menu in the Scene view control bar provides a list of options inside the dropdown menu. With the help of the menu, you will select the appropriate Draw mode, which is used to depict the scene. The shading mode is divided into three such as Shaded, Wireframe and Shaded Wireframe. The Shaded mode displays surface with visible textures, while the Wireframe mode is capable of drawing meshes with a wireframe layout. If you want to display textured meshes with visible wireframe, you can use the Shaded Wireframe option.

Some of the other menu options are Shadow Cascades, Render Paths, Alpha Channel, Overdraw, and Mipmaps. The Render Paths mode provides color code for each object. You will be able to visualize four colors such as
