

Understanding Gizmos Menu

The Scene View and the Game View share Gizmos menu, which is located at the top left side of the Toolbar. You will view several options such as 3D Icons, Show Grid, Selection Outline and Selection Wire upon clicking the menu.

The 3D Icons checkbox automatically verifies whether the component icons are drawn by the editor in 3D format. The icons are scaled by the editor as per their camera distance when this option is selected. You can set the size by using the slider. The icons are drawn at a fixed rate if this option not selected. The Show Grid option (not available in Games View) enables and disables the standard scene measurement. You can configure the grid colour by navigating to Unity>Preferences>Colours.

Working with Gizmos Menu

If the Selection Outline option is checked, you will view GameObjects with a coloured outline. You can modify the colour of the outline by visiting Unity>Preferences>Colors and providing the required colour. The Selection Wire option displays the GameObjects enclosed with the wireframe mesh and can change the colour. The Show Grid, Selection Outline, Selection Outline menu options are only visible in Scene View mode.

Understanding Icons

It is possible to display icons in both Scene and Game views. The icons look like a flat billboard-style that can be used to indicate the position of the GameObject. The Unity provides Camera and Light icons in both 2D and 3D mode. You can manage and control the visibility of the icons using the integrated components such as Animation, Animator, Camera, BoxCollider, AudioSource, Canvas and much more. The Gizmos menu also provides few scripts that perform several functions. You will find scripts with an icon and those that implement `OnDrawGizmos()` and `OnDrawGizmosSelected()` functions.

Conclusion

As you can see, Views provide a wide range of tools and utilities to simplify application development with Unity. You can make effective use of the
