

Search for Assets easily

The next button provides a list of all the assets according to their Label. Interestingly, the label menu also includes its own search box because of the large number of labels. You can add extra term directly into the search box such as “t:”, which will retrieve the specified asset type. Moreover, you can search for multiple type or label simultaneously.

Searching the Asset store

The Unity Asset Store is a place from where you can download free and paid products including items related to your query. You can instantly activate free assets just by double clicking on it. However, if you opt for a paid asset then you will have to complete the payment process. The system will first scan the asset name followed by the package name, label and description after you invoke the search. You will view complete details of the selected item in the inspector with the relevant purchase option. You can also preview the asset(s) that you are about to buy. However, this feature is only available to select items included with the library. You can also view the selected asset in the Asset Store portal with additional description including requirements related data.

Refine your Asset search effectively
