

instead of spending time with mouse. We have provided a list of available keyboard shortcuts below. It will take few days for you to work with the shortcuts but once you learned it's easy to work with the Project window.

The Hierarchy Window

The Hierarchy window provides a list of all GameObjects in the active Scene. The GameObjects are mainly direct instances of Asset files including instances of Prefabs. It is to be noted that Prefabs are customized objects that are used to build games. If you add objects to the scene, they will appear in the Hierarchy window. The objects will be removed upon deletion from the scene. In the Hierarchy window, the objects are listed in the order of creation. It is possible to change the order status of the objects by dragging up and down. You can also classify the objects as child or parent.

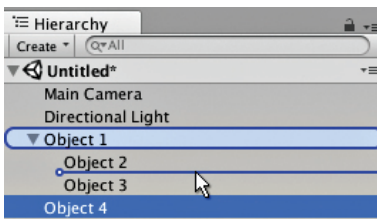

The objects are created in groups and are separated into parent and child objects respectively. While the top object is termed as parent, the objects placed below the main object are called as child. The Unity framework also provides an ability to create nested parent-child objects. The drop-down arrow located near the parent object can be used to show or hide child objects. Alternatively, you can press the ALT

key while selecting the drop-down arrow to visualize the child objects.

You just need to drag and drop the child object onto the relevant parent object to create child with any objects on the Hierarchy. With Unity, you can create as many child objects under the same parent object. To perform this, you need to drag the object up or down until a horizontal blue line appears on the screen. You need to drop the line at the relevant position.

Multiply objects easily by dragging

You can modify the order of the objects by activating Enable Alpha Numeric Sorting from the Edit | Preferences menu. If you are working with Mac, you need to select Unity>Preferences. You will view a dedicated icon in the top

right side of the Hierarchy window. The icon is used to toggle between Transform or Alphabetic sorting. The Hierarchy window includes one
