

active Scene. You can enable multiple Scenes with the help of multi-scene editing technique and the complete discussion is beyond the scope of this chapter. You are requested to refer to the official documentation for additional information.

The Inspector Window

The Inspector window provides complete overview about the active Game-Object. You will be able to know information about the various components and their properties including the ability to modify the behavior of Game-Objects. You should note that Unity projects comprises of a combination of scripts, sounds, meshes in addition to lights.

Understanding the Inspector Window

The Inspector is used to view and modify the properties such as Game-Objects, Assets and materials. You can also change editor settings and related preferences. The Inspector displays the properties when you select a Game-Object in either Scene or Hierarchy view. You can edit the settings of the components and materials from the Inspector window just like you do with the Properties window in Visual Studio IDE. For instance, if you are editing Camera component, you will be able to change background color, projection, field of view, clipping planes, depth, rendering path, HDR and much more.

If you are using custom script components with Game-Objects, the Inspector displays related public variables. It is possible to edit the values
