

just like you did with the components without touching the code. If Player script is activated, you can change smoke effect, heat effect, health and collection of sound. The properties will change depending upon the script you are working with.

If you select an asset in your Project window, the Inspector window displays the setting relevant to the Asset. It will show how the Asset is imported and used at run time. You should note that each Asset provides its own settings. For example, the settings of an Audio file will be different than that of a texture. You have to deal with the settings for each asset as per the requirements.

The GameObjects and scripts can be easily customized using icons that will be displayed in the Scene view. The Unity editor comes with integrated icons for GameObjects such as Lights and Cameras. You can easily reorder components by dragging and dropping the respective headers based on your project requirements. You will view a blue line when you attempt to drag a component header. You should release the mouse where you want the component to appear. It is also possible to drag and drop Assets from one location to another. If you are working with a large project, you can drag and drop components from the multiple GameObjects in the same way.

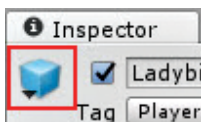

Editing Properties inside Unity Editor

Assigning icons

With Unity, you can assign custom icons for not only GameObjects but also scripts. The icons will be displayed in the Scene view alongside other default icons. Moreover, you should make use of the Gizmos menu to manage the appearance of the icons in the Scene view.

Changing GameObject Icon

To modify GameObject icon, you should select the relevant GameObject in the Hierarchy window and click the blue-coloured Select Icon button. You will be able to locate the button from the extreme top left
