

Roll a ball

Introduction, setting up the game and configuration settings

In this beginner assignment we are going to make a very simple but playable game to use many basic concepts that will aid you in your quest to create games of your own. We will be making a roll-a-ball game. When we are done we will have made a simple roll-a-ball game where the player controls the ball with the keyboard, picks up and counts special collectable objects, displays the current count and ends the game when all of the game objects have been picked up. We will create new game objects, add components to these game objects, set the values on their properties and position these game objects in the scene to create a game. In our game the player will control a ball rolling around the game board. We will move the ball using physics and forces. How, you ask? We will look at the input from the player through the keyboard and we'll use those inputs to apply
