

Creating a new project in Unity.

forces to the ball, making it move in our scene. We will see how to detect contact between the player's ball and the pick-up game objects, and use these events to collect these pick-up game objects. We won't import any assets for this project. We won't use models, textures, sounds or animations for this assignment. We will simply use the primitive shapes provided by Unity, and some fundamental concepts of game design.

Game Objects

Let's begin by reviewing the general hierarchy of things within Unity. Every 'thing' in the game is a game object (think object oriented programming). These objects have components, which are different aspects of the object, and each component has its own properties and values (some of which may
