

be common to more than one component). As a childish example, consider an object - 'Child'. We can attach a component to this object called Tantrums and set the Periodicity property of the Tantrums component to whatever we want (if only!). Now we can go ahead with creating a new project. Go to File > New Project. This will bring up the home screen. Call the new project Roll-a-Ball, or get creative. Then set the destination, or path to our new project. At this point it's worth noting that we can have our new project use default settings for either a 2D project or a 3D project, so choose 3D. Now we should have our new project with a new empty scene. Before creating anything in the new scene we need to save our scene (by going to File - Save Scene or by using the keyboard shortcut). We're going to call the scene MiniGame, like in the official tutorials, but it's a free country. You should now see in your Scenes folder the scene called MiniGame. Next we create our game board, or play field. To do this we will use a stock plane in Unity. We can create this plane from either Game Object > 3D Object > Plane, or from inside the Hierarchy view using the Create menu. You can rename this game object Board, or Ground. You can do this by either selecting the game object and using the enter or return keys to allow editing, or by clicking on the game object twice, slowly - like folders on a Mac. Reset the transform component using the context sensitive gear menu in the upper right. This will place the game object at the location of (0, 0, 0) in our scene. This point is known as the origin point of the world and this is where all of the coordinates in the scene are calculated from. Now with the game object selected, and the

Creating a new Plane.
