

Applying light settings to the scene.

lighting. However the white player sphere is on the white background, and that's not too visually appealing. We can solve that by adding some colour to our background so there is some contrast between the player and the play field. To add colour or texture to a model, we need to use a material. We need not go into the details of materials now, and we won't be using any textures. We will simply use a standard material to add colour to the objects in our scene. Think of it like a cloth on the wireframe of the object. We will create a separate new folder in our project to hold our materials. Do this by

Adding a material to the plane.
