

A game object and a playing field.

using the project's Create menu and selecting Folder. Rename this folder Materials. With the Materials folder selected use the project's Create menu again and this time select Material. The material should automatically be created in the Materials folder, if the folder was selected when you chose to create the new material.

Rename this material Background. Select the material and under Main Maps the first property is Albedo. Click on the Albedo's colour field to open a colour picker. Change the colour to a nice dark shade of whatever you want. In our case we will use the RGB values of `[0, 32, 64]` for a good old Blue. To see a preview of the material make sure that the preview window is open. To actually apply the texture to the plane, simply select the material in the project view and drag it onto the plane in the scene view. Now the player will stand out on the background. Now make one additional change that will help us later in this project. Rotate the main directional light so that we have better lighting on our player. Select the directional light and in the transform component change the Transform Rotation on the Y-axis to 60. This will give better shape to our player sphere. Now we have a player game object and a background play field.
