

```

• }
• void FixedUpdate () {
• float moveHorizontal = Input.GetAxis ("Horizontal");
• float moveVertical = Input.GetAxis ("Vertical");
• Vector3 movement = new Vector3 (moveHorizontal, 0.0f,
moveVertical);
• rb.AddForce (movement * speed);
• }
• }

```

## Moving the Camera

As of now, the camera doesn't move, and from its current position cannot see very much. We need to tie the camera to the player game object. To do this, first we set the position of the camera. Let's lift it up by 10 units and tilt it down by about 45 degrees. Next let's make the camera a child of the player game object. This is a typical third-person setup, with the camera as a child of the player. When we move the player's position the camera moves with it. When the player rotates the camera rotates as well. Let's look at this from a position where we can see both the player and the camera game object. Move the player, rotate the player, the child camera moves with it. Now let's reset the player and test. We enter play mode, hold down the up arrow to move, Whoa what's happening here? Okay, well as the camera is a child of the player's sphere, even though the camera is not moving at all relative to the player's game object, the player game object is rotating like crazy so the

The initial camera setup.
