

Eventually you will be able to create characters like these or even more advanced

Change the transform scale values on the right of the scene view to turn the cube into a long wall. Change x vector to 0.5 for the depth, y vector to 2 for height and z vector to 20.5 for length. This elongates the cube into a wall running across the origin point. To set it at the edge of the play area, you can use the Translate tool and push the wall into place with the mouse or again use the transform component. In the transform window, type in X value as -10 which will shift the wall to the edge. To create the opposite wall i.e East Wall, you can simply duplicate the West Wall. from the Edit menu, use the Duplicate function while the West Wall object is selected. Rename the new object. Since this wall has to go on the other end of the play area and all positional values are relative to the origin, the X value for East Wall will be opposite to that of West Wall. So remove the negative sign in X axis and the wall will snap into position at the opposite end. For the north wall again duplicate any of the existing walls and reset the position so that it's in the centre of the play area. You can either rotate the wall by 90 degrees or simply replace the x and z vectors values with one another.

Drag it into position or use the value of 10 in the positional Z field. Repeat the process used to create the East Wall to create South Wall from the North Wall.
