

You can now check out the rotation and orientation in real time

Another trick is to use a series of Constraints. So object A is constrained to object Z and object B is constrained to object A. So object Z determines object A which in turn determines object B.

Use the Inspector window to set or edit Constraint properties.

Rotation and Orientation

Rotation is a slightly topic but we will cover the bare minimum basics here to get you started. First of, understand that there are two types of rotation

An aiming feature in any game is always a constrained object dependant on the player
