

you need to add components to it. You have the freedom to add different combinations of these components basis the final effect that you want from the GameObject.

Unity comes with a number of different component types that are built into the system. Other than this, you have the freedom to get creative and make your own components using the Unity Scripting API.

What is a GameObject?

Characters, props, scenery - all of these fundamental objects in Unity are GameObjects. By themselves, they do not accomplish much. Their primary role is to be containers for Components. Components are what implement the real functionality of these GameObjects.

For instance, think of a 'light' object that is affixed on the wall of a prison in your game scenery. But this light object will be of value only when the Light Component is added to it.

The Transform component is affixed to any object but other components can be added. This is done through the editor's Component menu or from a script. One also has the option to avail of pre-constructed objects (primitive shapes, Cameras, etc) available on the GameObject > 3D Object menu.

Creating Collectibles

In the Roll a Ball game, the objective is to roll the player i.e. the ball around

Every single thing in a game is an object. So gameobjects are literally the building blocks for any game
