

Creating a collectible game object

the play area and collect objects scattered all over. This is done when the player touches any of these objects. So the next logical step is to create these collectible objects.

Create a cube and rename it 'Pickup'. Set it at origin by resetting the Transform values for the object. Focus in on the object by using the scene view on the cube. Since the Player object and the Pickup object overlap each other, you will need to deactivate it. Select the Player object and deselect the check-box in front of the Name field. The Player object is deactivated and no longer seen in view.

Do you see that the cube is buried in the ground? Remember encountering this earlier when you created the Player object? As you did then, change the Y-axis position of the cube to 0.5 so that it also rests on the plane. Now let's tweak this object so that it catches the gamer's attention. We will give it some effects, have it perpetually rotate along its axis, change the colour etc.

Scripting for Rotation

To make it float, you can increase the position value on the Y-axis or make it smaller so that it appears to be floating. For the purpose of this game, it's enough to reduce the size. Now let's give it some movement. Since it's a cube, first rotate it using the Transform component. In the rotation values, enter the numbers 45, 45, 45. This is step 1. The second step, movement is slightly more complicated and involves scripting. Keep the Pickup object selected and use the Add Component button in the Inspector to add in a script.
