

drag the Pickup object under this. Before that, ensure that the parent object is located at origin by using the reset feature.

Double check that the Pickup object is selected and not the parent and change the view to top-down by clicking on the Gizmo in the top right corner of the scene view and zoom to view the entire play area. Change the editor to Global mode from Local mode. When you move the object Local mode, it's moving in relation to it's gizmo, which is tilted over when we want to move it in alignment with the ground. So by changing the mode, you are now moving the object relative to the world's global axis.

Place the first Pickup object anywhere in the play area and while it's selected, duplicate by using the keyboard shortcut CMD + D (for Mac) or ctrl + D (for Windows). You can also use the longer (and boring) method of going to Edit → Duplicate. Create as many duplicates as you want (just don't go overboard and clutter up all the space) and place them in the play area. Also, make sure that none of them are at origin point. Again test. If you are satisfied, time to move on to the next step.

Beautification

To make the Pickup object stand out even more, try changing the colour. You can go through the long process you did when creating the Background colour or you can simply duplicate the existing material and rename it. Select the new material in Project view and change the colour to one of your choice. Maybe make it as golden and shiny as possible.

Now drag the material to any one of the Pickup objects and click on Apply in the Components window. This step is extremely crucial otherwise you will change the colour of only one object. When you click apply, you apply the settings to the entire prefab thereby changing the colour of all objects using that prefab. The other way is to simply change the material on the prefab asset directly. Just drag and drop the material onto the prefab asset in the project window and its done.

Collecting Objects

Now that you have made the shiny, attractive objects for the player to pick up, you need to provide the correct attributes and settings for them to be actually able to do so. You will need to set it up so that collisions between the player and object are detected and when

SIDE NOTE

The script editor can be opened irrespective of whether the object is active or not.
