

store the value of the counted collectibles and another tool to add to that value as the objects are collected. This tool will be added to the 'PlayerController' script.

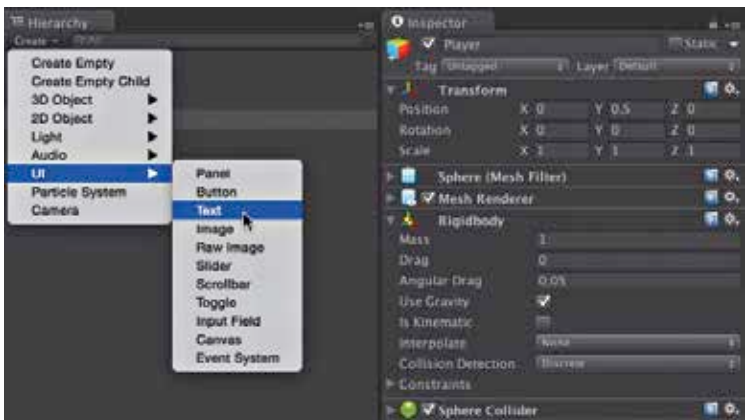

Adding up the Score

Select Player game object and open the 'PlayerController' script. You need to add an integer value (int) to a private variable which can be called 'Count'. Add in the line 'private int count;' below 'private Rigidbody rb;'. You are using int since there are only whole numbers being added and not partial values or fractions.

The starting point of 'Count' is 0 with increments of 1 as the objects are collected. The starting value needs to be set in the script since this is a private variable and hence will not be available in the Inspector window. To set count starting value as 0, in the beginning part of the code, under 'void Start', add in the line 'count = 0;'.

This count will increase as the objects are collected and this logic is set in the 'OnTriggerEnter' section. As of the last chapter, the last line in this section was 'other.gameObject.SetActive (false);'. Below that, add in the line 'count = count + 1;'. This means that the count function will increase by 1 every time the other gameobject which is tagged with 'Pick Up' is deactivated upon collision.

So you have created a tool to hold the scoring values, but not a way to display them in the game.
