

Displaying Scores and Text

Unity provides a native text tool to add text to your game. In the Hierarchy's window 'Create' menu, click on 'Text'. When you add the 'Text' element, Unity also automatically adds in a parent and canvas element and an event

It is imperative that you provide a way to keep score in any game otherwise the entire game becomes pointless right?

systems game object. These are all required by the UI toolset and have to be a child of a canvas to behave correctly.

Customize the 'Text' element by renaming it to 'Count Text' and changing the colour and text size from the inspector window. To shift the text from the centre of the window to the upper left corner, go to the 'Transform' tool. Note that the 'Transform' tool is different from what you have been seeing until now. Instead of the regular Transform, you have the 'Rect Transform'. There are other specialised features available to

make the UI system more versatile. In case of a text element, it is anchored to the centre of its parent which is Canvas in this case.

Click on the button displaying the current anchor preset to open the 'Anchors' and 'Presets' menu. To re-anchor the text and set the pivot and the position based on the new anchor, hold down both the Shift and the Alt keys and select the upper left corner button. To add in some margins to the text and the game screen edges, add in values of 10 and -10 to positions X and Y respectively in the Rect Transform window.

Now it's that time of the process again – scripting. Open up the 'Player-Controller' Script and add in a new 'namespace' at the top of the script called 'UnityEngine.UI;'. Using this namespace, you can 'tell' the Unity engine about the UI toolset and how it should work and what functions it will perform. Create a new public variable called 'countText' by adding in a line 'public Text countText;'. This is written below the 'public float speed;' line. This public variable is the reference to the UI text displayed.

Create a new function with 'void SetCountText' and an empty set of parentheses and brackets. Between the brackets, write 'countText.Text =
