

“Count: “+ count.ToString below count = 0;’. Don’t forget the parenthesis, they are extremely important. In the Start section, add in a line ‘SetCountText ();’. This defines a starting value to the ‘countText’ variable. Add in this line, ‘SetCountText ();’, to the ‘OnTriggerEnter’ section too. This is needed since the count text is dependent upon the trigger collider function being called.

As you go back to Unity, you will see that the ‘PlayerController’ script window has a new property called Count Text. Reference ‘CountText’ game object to this new property by dragging and dropping it on the slot. Unity will automatically associate the reference to the game object. Test all the additions and changes.

Next step is to display a message informing the gamer that the objective has been achieved and that they have won. Add in another UI text object from the Hierarchy’s Create menu, rename it ‘Win Text’ and tweak the text properties. This new element is also added to the canvas parent. Previously, you anchored the text to upper left corner but the win message should be displayed in the centre and slightly upwards. Give a value of 75 to the Rect Transform’s Y position. Open the script and add a public variable with code ‘public Text winText;’. Add in a start value with the line ‘winText.text = “”;’ in the Start section. So the text property will start empty. Now you need to set a condition which will determine if the win text should be displayed or not. The condition will be that if all the Pickup objects are collected, the message should be displayed. So in the SetCountText function write

Collecting and counting pickups
