

Adjusting the alignment and text

```

• if (count >= 12 {this is the number of collectible
objects you have used})
• {
•     winText.text = "You Win!";

```

This specifies that when the Player collects 12 objects, the win message “You Win” will be displayed on screen. When you return to Unity, you will see that the ‘PlayerController’ has a new UI text property. Drag and drop the ‘WinText’ game object in to the component slot as done earlier. Test out the game and check that when you collect all the objects or whatever number of objects you have specified in the code, the win message is displayed.

Canvas and Events System

As you have seen till now, the Canvas is the main component of Unity’s UI system. It is the area that holds UI elements. The Canvas is a Game Object with a Canvas component on it and as already seen, all UI elements must be children of such a Canvas. The Canvas area is shown as a rectangle in the Scene View. This makes it easy to position UI elements without needing to have the Game View visible at all times.

The order of the elements in the Canvas is as per the order shown in the Hierarchy. The first child is drawn first, the second child next, and so on. If two UI elements overlap, the later one will appear on top of the earlier one. You can reorder these elements at any time to change the display order.
