

PROPERTY:	FUNCTION:
Pos (X, Y, Z)	Position of the rectangle's pivot point relative to the anchors.
Width/Height	Width and height of the rectangle.
Left, Top, Right, Bottom	Positions of the rectangle's edges relative to their anchors. This can be thought of as padding inside the rectangle defined by the anchors. Shown in place of Pos and Width/Height when the anchors are separated (see below).
Anchors	The anchor points for the lower left corner and the upper right corner of the rectangle.
Min	The anchor point for the lower left corner of the rectangle defined as a fraction of the size of the parent rectangle. 0,0 corresponds to anchoring to the lower left corner of the parent, while 1,1 corresponds to anchoring to the upper right corner of the parent.
Max	The anchor point for the upper right corner of the rectangle defined as a fraction of the size of the parent rectangle. 0,0 corresponds to anchoring to the lower left corner of the parent, while 1,1 corresponds to anchoring to the upper right corner of the parent.
Pivot	Location of the pivot point around which the rectangle rotates, defined as a fraction of the size of the rectangle itself. 0,0 corresponds to the lower left corner while 1,1 corresponds to the upper right corner.
Rotation	Angle of rotation (in degrees) of the object around its pivot point along the X, Y and Z axis.
Scale	Scale factor applied to the object in the X, Y and Z dimensions.
