

Building the game

Converting the project into platform executable files ready for deployment

So you have created the game. Now all you need to do is to package the relevant files in the required format and deploy it to the systems. This is where you Build the game. You can even build a game halfway through to test it outside the editor.

To start, open Build Settings from File → Build Settings. A new window with a variety of options will open. The top pane is the scene list. This includes all the scenes that you want to build. To include scenes, simply drag and drop scenes from the project window. Unity will use the scenes listed in this pane to build the game. You can choose not to add all the available scenes in your project. If you are wondering why you may not want to include all, its possible that you created some test scenes or test levels
