

ANDROID	
Option	Purpose
Texture Compression	Choose from the following texture compression formats: Don't override DXT (Tegra) PVRTC (PowerVR) ATC (Adreno) ETC (default) ETC2 (GL ES 3.0) ASTC
ETC2 fallback	For Android devices that don't support ETC2, override the default ETC2 texture decompression by choosing from 32 or 16 bit format, or 32 bit format with half the resolution.
Build System	
Internal (Default)	Generate the output package (APK) using the internal Unity build process, based on Android SDK utilities.
Gradle (New)	Generate the output package (APK) using the Gradle build system. Supports direct Build and Run and exporting the project to a directory. This is the preferred option for exporting a project, as Gradle is the native format for Android Studio.
ADT (Legacy)	Export the project in ADT (eclipse) format. The output package (APK) can be built in eclipse or Android Studio. This project type is no longer supported by Google and is considered obsolete.
SDKs for App Stores	Select which third party app stores to integrate with. To include an integration, click Add next to an App Store name. The Unity Package Manager automatically downloads and includes the relevant integration package.
