Other platforms

Console platforms and devices which require a Unity license will be documented in the Platform Specific section of the User Guide.

Generic items across builds

Option	Purpose
Development Build	Allow the developer to test and work out how the build is coming along.
Autoconnect Profiler	When the Development Build option is selected allow the profile to connect to the build.
Script Debugging	When the Development Build option is selected allow the script code to be debugged. Not available on WebGL.
Scripts Only Build	Build just the scripts in the current Project.
Compression Method	Compress the data in your Project when building the Player. This includes Assets, Scenes, Player Settings and GI data. Choose between the following methods:
Default	On PC, Mac, Linux Standalone, and iOS, there is no compression by default. On Android, the default compression is ZIP, which gives slightly better compression results than LZ4HC, but data is slower to decompress.
LZ4	A fast compression format that is useful for development builds.
LZ4HC	A high compression variant of LZ4 that is slower to build but produces better results for release builds.

Now it's time to understand the Player Settings option. This button lets you set various options for the final game built by Unity. Some of the settings are the same irrespective of the platform but most are platform specific. These include:
