

- **Resolution and Presentation:** settings for screen resolution and other presentation details such as whether the game should default to fullscreen mode.
- **Icon:** the game icon(s) as shown on the desktop.
- **Splash Image:** the image shown while the game is launching.
- **Other Settings:** any remaining settings specific to the platform.
- **Publishing Settings:** details of how the built application is prepared for delivery from the app store or host webpage.

THE GENERAL SETTINGS ARE

Property:	Function:
Cross-Platform Properties	
Company Name	The name of your company. This is used to locate the preferences file.
Product Name	The name that will appear on the menu bar when your game is running and is used to locate the preferences file also.
Default Icon	The default icon that the application will have on every platform. You can override this for specific platforms.
Default Cursor	The default cursor that the application will have on every supported platform. The supported platforms are PC, MAC and Linux standalone, WebGL, PS4 and Windows store.
Cursor Hotspot	Cursor hotspot in pixels from the top left of the default cursor.
LZ4	A fast compression format that is useful for development builds.
LZ4HC	A high compression variant of LZ4 that is slower to build but produces better results for release builds.

Now click on Build button. Select the name and location for the game. Ideally, the location should be a root folder in the projects folder. When you click Save, Unity will build your game with the relevant files required
