

The survey further goes on to talk about how the exports from such companies help developing industries and startups meet their production goals to a staggering 59 percent.

In the U.S, exporting SMEs estimate that their revenue will rise by an average of 26.3 percent in three years, and 42.2 percent within five years if they use imported goods. A 2015 study by Industry Canada also propounded that exporting companies, on average, see nearly double the annual revenue of non-exporting companies. Top industry giant Deloitte also added that exporters earn triple than average seen for a three-year cumulative return of non-exporters thanks to a growing number of consumers all over the world.

But let's not just restrict to the businesses alone. Consumers too are on a high roll as businesses bringing imported goods are spouting about everywhere. And where there's a niche or market to take up, there are local traders making use of such markets to help connect consumers to exactly what they want.

Other than reduced prices and the benefits of a larger workforce, importing goods does leave a need for greater improvements on the local scene with traders now having to engage in special schemes and offers. The entire thing though ends up becoming a trade war between global producers at the hands of smaller merchants.

Sometimes such competitions prompt companies to adopt smarter ways to sell themselves. 40 percent of SMEs who have begun importing within the past two years reported employment growth, as did 20 percent of those who have already been doing so for ten years or more.

As for research and development, 59 percent also said they had either created a new product or refined an existing product for international markets as a result of imported goods entering the scene.

Such changes have vastly increased product lifespans and reduce overall risks. With suppliers and customers situated across several countries, companies are far less vulnerable to economic decline, decrease in product interest, and other major issues in any one market.

The bottom line

The best testimony against manual importing comes straight from India. There are currently 147.8 million eCommerce users in India, with rapid growth projected that will see an additional 210.46 million users by 2020. And this counts for just 36 percent of the total population.
