

allows you to see at a glance, how many of the consumers were really satisfied with the product that they have purchased. It is best to avoid anything that is less than a D grade. The Fakespot grade is invariably lower than the rating given to the product by Amazon itself. The analysis for each product is saved directly on the servers of Fakespot, and at times this analysis can be a few months old. The workaround is to reanalyse the reviews for the product, if the analysis is more than a few months old. As the process involves machine learning algorithms, it can be quite some time before a new rating is thrown up. An analysis of the reviews will also show specific indicators on the quality of the product. Below that will be short and sweet summaries of the reviews. Fakespot is a great tool that allows consumers

Fakespot

to get the most information out of all the reviews, at a glance. The plugin can be configured to work in realtime, and only requires users to login to Chrome. It is also possible to avoid using the plugin entirely, and directly check the product listing by feeding in the complete URL of the product, at the Fakespot website, at www.fakespot.com.

Reviewmeta

If you want more granular information on various aspects of the reviews, then Reviewmeta is the tool you need to use. Although Reviewmeta uses machine learning algorithms as well, it goes into much more detail than Fakespot. Reviewmeta really takes analysing its reviews seriously. All you have to do is go to the website at reviewmeta.com, and paste the URL of the product here. Then you get a warning if there are any “unnatural” reviews
