

detected, right at the top of the page. This is just a summary of the detailed analysis, informing you how likely it is that the sellers have tried to game the site by feeding in reviews to a product. There will also be an adjusted rating, taking in all the legit reviews into consideration, and ignoring the ratings that are considered unnatural. If the difference between these two is not that significant, it is an indication that despite the presence of unnatural reviews in the mix, they do not form a significant portion of all the reviews, and therefore the product is safe to buy, or at least the score showed on Amazon is more or less accurate. Then there is a report card on various parameters of the particular review, sorted into pass and fail categories.

Reviewmeta

Here is where the things get really interesting. Below that, there will be a list of most trusted reviews, and a list of least trusted reviews. Next to each review, will be additional information about that particular review, such as if the reviewer has a history of giving high ratings, if the reviewer has only ever reviewed one product, and if the reviewer has made a verified purchase. Here, a verified purchase indicates that the reviewer has actually purchased the product through the website, and has not merely written in a review even without purchasing the product. But wait, there is more! Much, much more.

Below that, there is a list of even more detailed analysis of the reviews, according to each parameter. Reviewmeta will show you what percentage of the reviews have been written by accounts that have only one review on the site. Then it will show the aggregated scores of those who have written
