

While VR may have its charm, people complained of problems ranging from cost effectiveness to motion sickness

enough engaging, immersive and compelling content was being created keeping VR in mind.

AR More 'Natural'

A lot of VR critics agree on this one point - VR has not yet been able to prove itself useful in the sense of being a 'seamless experience', which is possibly why we have not been able to integrate it into our daily lives. The most common device associated with VR is the (usually bulky) headset and such add-ons do not usually inspire customer usage.

Gaming enthusiasts are known to be excited about the prospects of VR, thus proving what ardent AR enthusiasts have always maintained - that VR will feed entertainment more than utility. AR has, on the other hand, introduced a tangible connectivity between humans and aspects in our environment that are important to us. This tangible connectivity could better the way we live our everyday lives. Until VR manages a way to feel more 'natural', AR might keep outdoing it at lightning speed.

AR Financially Viable

For any company to invest in technology and its creation, the said technology needs to show signs of being financially viable. Given that VR seems to be
