

looking more and more like a subset of the gaming industry and that AR looks like it is becoming mainstream, it should come as no surprise that more companies will look at putting their money behind AR.

With a host of tech advancements, AR has become accessible on smart-phones. With the sudden and booming success of Pokemon Go back in 2016, development tools like Google's ARCore and Apple's ARKit began hitting the market. Combine this with the smashing success of Snapchat lenses and filters and you know you have landed a recipe for success. These tools have ensured that new and interesting content is being developed on a regular basis, thus hastening consumer experience of AR on an almost daily basis, if not more regularly. This is perhaps the primary reason why AR is growing as fast as it is, where VR seems to be leveling off or perhaps, even going downhill.

Industry experts have gone as far as estimating that by the end of this year, countries like the US will see numbers close to 51.2 million in the AR users realm. This is a giant leap in comparison to the numbers of VR users which is close to 36.7 million. AR comes out a clear winner. Numbers never lie, do they?

Who Is Investing In AR and its Success?

While we talk about a number of companies that are heavily invested in AR and want to see it succeed, here is a comprehensive look at a few forerunners and how their involvement makes all the difference.

AR being implemented by museums to make the entire experience more immersive for viewers
