

Apollo 11 astronaut Buzz Aldrin tries his hands on the Microsoft HoloLens

another extremely interesting use of AR was seen in the partnerships between Tango and several museums. This meant that every time a visitor uses their mobile phone to x-ray scan the fossils of a dinosaur and they would be privy to seeing an AR created version of what the actual animal looked like. Alongside, it would display general details about the species and other information as required. This makes the entire experience even more immersive and robust for the visitor.

As of March 1st 2018, Google Tango was shut down as a project and the reason for its demise is a rather good one - Google ARCore. Google announced that they would be shifting all their AR focus onto Google ARCore from hereon.

Microsoft

This name belongs firmly on this list. Microsoft made its first foray into the world of AR with their product Microsoft HoloLens. This AR headpiece was built to map out the user's physical environment and display virtual objects in the line of sight. The tech was also built so as to integrate it with social media apps like Skype, thus allowing users to look through the lens while performing other tasks.

Microsoft has always maintained that they prefer calling their technology 'Mixed Reality' vs the commonly used terms 'Augmented Reality' or 'Virtual
