

Reality'. The company went one step ahead with their AR or MR plans when they applied for a patent to use AR to help with object tracking. This patent could be used to identify objects and also monitor their locations. While in theory, this patent could point us in the direction of the tech being labelled as 'immersive', there are possibilities that demonstrate that the tech could have a wide array of uses for day to day living. Imagine being able to track lost objects. AR technology could help you get the job done.

Regardless of whether you are in the AR camp or the VR camp, what eventually matters at the end of the day is market application of the technology. Given that AR has found its way into almost every hand via mobile apps and programs that use the tech, it comes as no surprise that AR is steadily taking over VR with every passing day.
