

But that's not the only thing ARKit is good for. Here's a look at a number of different apps that can tell you how creative you can get with this platform.

Fitness AR -

This one puts the fun into fitness. All users of the fitness website, Strava, can use this app to visualise their runs, hikes or more on virtual 3D maps. These maps are as detailed as can be with actual terrain information as well as landmarks that the user will encounter in the real world.

IKEA Place -

This one is almost self explanatory given the name. Use this app to let you try items from IKEA at the comfort of your very own home. See how that new table will look next to the brown couch you already own. Virtual representations of their items in the real world help you make more informed home-decor decisions.

AR apps like these can help tourists stay informed about local data

The Machines -

If you are looking for some serious action right in your living room, you could choose to create a battlefield diorama with The Machines. This app lets you go to war with a squad of robot soldiers right in the comfort of your own home.
