

the same, this would create a more natural and realistic interaction with your environment.

While step one is to create AR apps on the mobile phone, it will be fun to see the development of AR tech reach a stage of it becoming the proposed 'invisible computer' (in the words of Norman). ARKit and ARCore are but a means to an end in that sense. If they continue developing the way they are currently, we could hope to see hardware development as well that could help elevate AR to the next level where we could finally untether it from the confines of the 5 something inch smartphone. Now that would be interesting, wouldn't it?
