

Apple unveiled the ARKit in 2017 to a crowd that was probably more concerned about the latest iPhone release and became the company's answer to the ARCore common among Android developers. Since then it has opened new gateways as to the approach used by students, developers and companies to bring the AR edge to their works. Before jumping to the deeper end of the AR coding world, let's review some things to take care of to set up and create a suitable environment for both ARKit and ARCore.

No longer are the potentials of advanced technology restricted the big production houses. They can be availed well enough from some softwares provided which needs some work put into them and a lot of practice.

To begin with, both ARKit and ARCore happen to be great tools for placing interactive virtual tools in a software rendered environment and then blending them with the physical dimension that the app captures. Feels like a Pokemon GO route to make apps, but that's what it exactly is.

GETTING STARTED WITH ARKIT

ARKit runs only on Apple iOS devices with an A9 processor or newer processors. Having a working camera on the iOS device is recommended as ARKit relies upon it heavily. You will need a cable extension for connecting your device to your Mac computer.

- For the MACs, the OS Sierra 10.12.4 is suggested.
- Download Xcode 9 (which contains ARKit) for your Mac for free from Apple's developer website.
- To do this, open your Mac and create an Apple developer account. This will prompt the website to create a download button. Make sure there's enough space- up to 10 GB or more- on the system to accommodate the SDK.
- Launch the Xcode 9 platform and connect your iOS device to your computer with a cable link.
- On your Mac, unzip the Xcode 9 essentials and drag them to the Applications folder and double-click it to launch it.
- Connect in the iOS device you have with iOS 11 installed.

MOVING ON WITH ARKIT

Now it's time to bring out the goods. You can now move to some of the advanced steps you will need to perform in order to set up ARKit. Let's get into these steps-
