

Tablet VR App

Now move from storyboard to the controller.swift file. Use this environment to create a property of type ARWorldTrackingConfiguration using the DidLoad() method.

```
• import UIKit
• import ARKit
• class ViewController: UIViewController {
• @IBOutlet weak var sceneView: ARSCNView!
• let config = ARWorldTrackingConfiguration()
• override func viewDidLoad() {
• super.viewDidLoad()
• }
```

To debug the program after running it, click on the compiler tag and review any code chunks that are returning errors. Start the AR session by putting the config file in the sceneView and write.

```
• sceneView.session.run(config)
```

Run the app on the connected device and if the system alerts for permissions, allow the device to access the camera.

Don't forget to give the app permission to use your device's camera
