

```

• func renderer(_ renderer: SCNSceneRenderer, didAdd node:
SCNNode, for anchor: ARAnchor) {
• guard let planeAnchor = anchor as? ARPlaneAnchor else
{return} //1
• let planeNode = createFloorNode(anchor: planeAnchor) //2
• node.addChildNode(planeNode) //3
• }

```

And just like that, hit the render button and you've got a working object in real time. Next, let's take a look at ARCore.

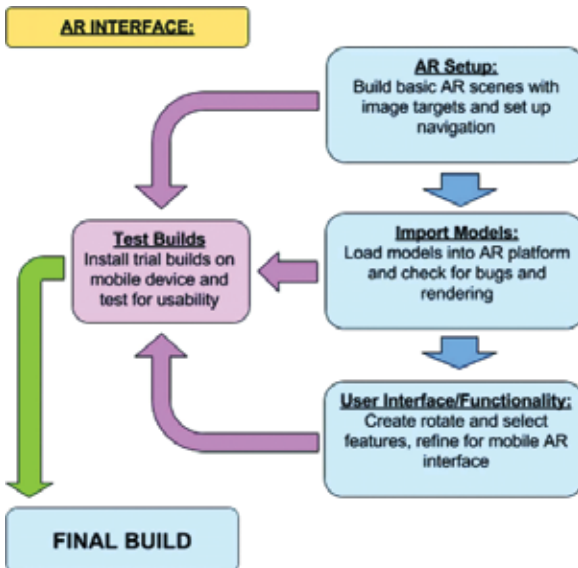

WORKING WITH ARCORE

Start from the Sceneform platform to build AR projects without OpenGL. But if you don't want to use ARCore in your app, then disable it from the ARCore Developer window.

You can either download the Sceneform samples online or extract them from the github repository by typing:-

<https://dgit.in/androidsceneform>

In the Android SDK, open the HelloSceneform sample project and activate the device or emulator

Steps to building an AR interface
