

Note that you need Android Emulator version 27.2.9 or higher supported by OpenGL ES 3.0 or higher.

Configure the emulator and select Settings, then Advanced, hover to OpenGL ES API level and select Renderer maximum. Click it and restart the emulator.

It's important to understand that if you have lower versions, the desktop GPU won't be able to support OpenGL and would require a supported device to run Sceneform apps.

Type `adb logcat | grep eglMakeCurrent` to check the status of the current version.

Run the sample file and make sure that the Android device is connected to the development machine and click Run in Android Studio. Select your device once it pops up and click deployment target, then click OK.

Enable VR Apps with QR Code

Following the above will cause Android Studio to build your project into a debuggable APK. The system will then install the APK and run the app on the device.

You would have noticed that the `hellosceneform` app lets you place and manipulate Android shapes on flat surfaces. Add the Sceneform to an existing project.

To add it to the environment, drag the sceneform library to the app's build. Gradle file.

- `android {`
