

```

•      // Sceneform libraries use language constructs
from Java 8.
•      // Add these compile options if targeting minSdk-
Version < 26.
•      compileOptions {
•          sourceCompatibility 1.8
•          targetCompatibility 1.8
•      }
•  }
•  dependencies {
•      ...
•      // Provides ArFragment and other UX resources.
•
•      implementation 'com.google.ar.sceneform.
ux:sceneform-ux:1.5.1'
•      // Alternatively, use ArSceneView without the UX
dependency.
•      implementation 'com.google.ar.sceneform:core:1.5.1'
•  }

```

Run any other projects in the ARCore SDK and Sceneform samples after which you're good to go. By the end of this run, you would have completed your first ever program on the ARCore environment. The following code will add the VR element to the scene and allow for you to interact with it by rotating and moving it.

```

• private fun placeObject(fragment: ArFragment, anchor:
Anchor, model: Uri) {
•
•     ModelRenderer.builder()
•
•     .setSource(fragment.context, model)
•     .build()
•
•     .thenAccept {
•
•         addNodeToScene(fragment,capsule, it)
•
•     }
•
•     .exceptionally {

```
