

ARKit and ARCore

SAMPLE SCENES IN ARKIT

To open up sample scenes in ARKit, we'll begin with using the Quick Look app that can easily transfer the AR elements between the computer and any other mobile device connected to it.

Have the device connected and open up the environment. One advantage of using Quick Look is that all that's needed to make the sample scenes work is to tell the system which files you want to load and view.

Before we start working on Xcode to create a sample scene, learn about the file type that we'll be working with. It's called USDZ and stands for Universal Scene Description Zip. Fun Fact, the filetype was started as a collaborative project between Pixar and Apple.

It's nothing but a zip archive that stores all the packages and textures into a single file. This is why USDZ files are used for Quick Look and not any other 3D model format.

First, insert the code to convert the file to the right format.

```
• xcrun usdz_converter /Users/You/PATH/TO/egg.obj /
  Users/You/CHOOSE/A/PATH/TO/SAVE/egg.usdz
• xcrun usdz_converter /Users/You/PATH/TO/egg.obj /
  Users/You/CHOOSE/A/PATH/TO/SAVE/egg.usdz
```

Begin by downloading the sample file and specify the file type at the end in Xcode. After running the app code, you'll see models which don't respond when you click on them.

Drag the model to the Models folder and when dropping it, check the target box that appears.

Next, head over to ViewController.swift and add the model to the model's array. The model will show up in the list first when it's run. To be sure, run the app again. Add the following code to bring visibility to the native sample scene so that others can view it as well.

```
• import UIKit
• import Foundation
• import QuickLook
• class ViewController: UIViewController, UICollectionView-
  ViewDelegate, UICollectionViewDataSource, QLPreviewCon-
  trollerDelegate, QLPreviewControllerDataSource
```

Two separate models have to be added to configure the protocols needed for the sample set up. This is the numberOfPreviewItems() and
