

```
View, didSelectItemAt indexPath: IndexPath) {
    • thumbnailIndex = indexPath.item
    • let previewController = QLPreviewController()
    • previewController.dataSource = self
    • previewController.delegate = self
    • present(previewController, animated: true)
    • }
    • func collectionView(_ collectionView: UICollectionView,
View, didSelectItemAt indexPath: IndexPath) {
    • thumbnailIndex = indexPath.item
    • let previewController = QLPreviewController()
    • previewController.dataSource = self
    • previewController.delegate = self
    • present(previewController, animated: true)
    • }
}
```

This will open up and set the final sample scene.

SAMPLE SCENES IN ARCORE

The SceneView class lets you render a 3D scene without the use of a camera or a device connected to the system. To set a sample scene, first define the background colour in the layout using the following code:

```
/// <summary>
/// Unity update.
/// </summary>
public void Update()
{
    // Do not update if ARCore is not tracking.
    if (Frame.TrackingState != FrameTrackingState.Tracking)
    {
        return;
    }

    // Fill in the data to draw the point cloud.
    PointCloud pointcloud = Frame.PointCloud;
    if (pointcloud.PointCount > 0 &&
        pointcloud.Timestamp > m_lastPointCloudTimestamp)
    {
        // Copy the point cloud points for mesh vertices.
        for (int i = 0; i < pointcloud.PointCount; i++)
        {
            m_points[i] = pointcloud.GetPoint(i);
        }

        // Update the mesh indices array.
        int[] indices = new int[pointcloud.PointCount];
        for (int i = 0; i < pointcloud.PointCount; i++)
        {

```

A point cloud is a set of data points in space
