

```

•         ARHitTestResultType[] resultTypes = {
•         ARHitTestResultType.ARHitTestRe-
sultTypeExistingPlaneUsingExtent,
•         // if you want to use infinite
planes use this:
•         //ARHitTestResultType.ARHit-
TestResultTypeExistingPlane,
•         ARHitTestResultType.ARHitTestRe-
sultTypeHorizontalPlane,
•         ARHitTestResultType.ARHitTestRe-
sultTypeFeaturePoint
•         };
•
•         foreach (ARHitTestResultType result-
Type in resultTypes)
•         {
•             if (HitTest-
WithResultType (point, resultType))
•             {
•                 ani-
mation.Play ("Take 001", 0, 0.0f);
•                 return;

```

BUILD SETTINGS IN ARCORE

First import the ARCore SDK for Unity and configure the app to AR Required or AR Optional.

In Unity's Project window, check for the SDK files and the HelloAR sample app in Assets.

There are two ways to enable ARCore as mentioned, either by using AR Required or AR Optional.

AR Required will provide no AR capabilities to the app configuration setup. Make sure that the app is configured for the same and then move to Build scene and Configure scene options in the File menu. Fill in the details that appear in the window and fill in the required build parameters such as lighting, design, shape, reaction and much more. To test it, run a sample code by using the following commands and click on Run to view the results.

```

• sceneform.asset('sampledata/Heart.obj',
•     'default',
•     'sampledata/object.sfa',

```
