

BUILDING AN APP ON ARKIT

Open up Xcode and set the environment by bringing up the ARSCN View. This code is an extension of the code from the previous tutorials where the objects will be placed in a portal.

```
• @IBOutlet var sceneView: ARSCNView?
• @IBOutlet weak var messageLabel: UILabel?
• @IBOutlet weak var sessionStateLabel: UILabel?
• -----
```

Open PortalViewController.swift and setup ARKit.

```
• func runSession() {
•   let configuration = ARWorldTrackingConfiguration.
init()
•   configuration.planeDetection = .horizontal
•   configuration.isLightEstimationEnabled = true
•   sceneView?.session.run(configuration)
•   #if DEBUG
•       sceneView?.debugOptions = [ARSCNDebugOptions.show-
FeaturePoints]
•   #endif
• }
```

Reset the texture and opacity of the images by using the following code:-

```
• func resetLabels() {
•   messageLabel?.alpha = 1.0
•   messageLabel?.text =
•       "Move the phone around and allow the app to find a
plane." +
•       "You will see a yellow horizontal plane."
•   sessionStateLabel?.alpha = 0.0
•   sessionStateLabel?.text = ""
• }
• -----
• -----
• override func viewDidLoad() {
•   super.viewDidLoad()
•   resetLabels()
•   runSession()
• }
```
