

```

•         "Tap on the detected horizontal plane to place
the portal"
•         }   }}
• -----
-----

```

After bringing in the images, set the images and scene up for rendering through the same code:

```

• func renderer(_ renderer: SCNSceneRenderer,
•             didUpdate node: SCNNode,
•             for anchor: ARAnchor) {
•     DispatchQueue.main.async {
•         if let planeAnchor = anchor as? ARPlaneAnchor,
•             node.childNodes.count > 0 {
•             updatePlaneNode(node.childNodes[0],
•                             center: planeAnchor.center,
•                             extent: planeAnchor.extent)
•         }   }}
• -----
-----

```

The following node update code will help in tracking the movement of the portal and help keep the position updated in the system under an array. After this you can successfully run and build the app with the results being visible in the Xcode environment.

```

• func updatePlaneNode(_ node: SCNNode,
•                     center: vector_float3,
•                     extent: vector_float3) {
•     let geometry = node.geometry as? SCNPlane
•     geometry?.width = CGFloat(extent.x)
•     geometry?.height = CGFloat(extent.z)
•     node.position = SCNVector3Make(center.x, 0, center.z)
• }

```

BUILDING AN APP ON ARCORE

ARCore SDK Coding

First start by using the SDK and setting up an object that can be designed using the Unity system as well.
