

The following code will act as the essentials for animating the nodes of a sample object – a droid and rendering it in real time.

```
• private var droidRenderable: ModelRenderable? = null
• override fun onCreate(savedInstanceState: Bundle?) {
•     initResources()
• }
• private fun initResources() {
•     // Create a droid renderable (asynchronous operation,
•     // result is delivered to `thenAccept` method)
•     ModelRenderable.builder()
```

How will you know if you win without a score?
